Design review: voice edit latency

The voice edit route records the transcribe time, the plan time and the time the user waits after confirming. Speculative planning starts as soon as the transcript is ready. Alternatives are validated against the DSL before they are returned. When the local fast path hits, no model is called at all, and the answer comes back in a few milliseconds. This paragraph is long enough to wrap across two columns so the reading order matters: left column first, then right.

Engine	p50 (ms)	Notes
whisper.cpp	2100	in-process
faster-whisper	380	sidecar
groq	240	hosted

Unicode: café, naïve, Zürich — “quotes” and an emoji-free line. Tamil: தமிழ் எழுத்து. Ligatures: office, affluent.
